## **Listing of Claims**

Claim 1. (previously presented) An electromagnetic regeneration valve for venting a tank of a motor vehicle, the regeneration valve being actuatable by pulse-width modulation and having a pulsed mode and a proportional mode having a higher frequency than the pulsed mode comprising:

a solenoid, and circuitry configuration including:

a power source for supplying the solenoid with electricity;

a control unit for generating pulse-width-modulated signals;

a switching device, the solenoid capable of receiving the pulse-width-

modulated signals of the control unit via the switching device; and

a suppression device for suppressing high induced voltages at the solenoid, the solenoid in the proportional mode having a position corresponding to a mean current level.

- Claim 2. (previously presented) The electromagnetic regeneration valve as recited in claim 1, wherein the suppression device includes a free-wheeling diode connected in parallel to the solenoid.
- Claim 3. (previously presented) The electromagnetic regeneration valve as recited in claim 1, wherein the regeneration valve is actuatable in the proportional mode with a pulse frequency of between 20 Hz and 200 Hz.
- Claim 4. (previously presented) The electromagnetic regeneration valve as recited in claim 3, wherein the regeneration valve is actuatable with a pulse frequency of about 50 Hz.
- Claim 5. (previously presented) The electromagnetic regeneration valve as recited

in claim 1, wherein the power source includes the vehicle's electrical system.

- Claim 6. (previously presented) The electromagnetic regeneration valve as recited in claim 1, wherein the control unit includes an engine controller.
- Claim 7. (previously presented) The electromagnetic regeneration valve as recited in claim 1, wherein the switching device includes a power transistor.
- Claim 8. (previously presented) The electromagnetic regeneration valve as recited in claim 7, further comprising a further diode connected in parallel to the power transistor.
